

Release DocIntegrate 4.3.2

Stability & Reliability

- Fixed an issue where documents with long file paths on Windows could fail to open or sync correctly
- Fixed false notifications about document changes on Windows when no actual changes occurred
- Improved application startup reliability — fewer failed launches when opening documents from the DMS
- Documents are now tracked more reliably when multiple documents are opened at the same time, preventing conflicts
- Fixed a rare issue where document locks could become stale, causing documents to appear locked after being closed

Document Handling

- Opening the same document link multiple times no longer causes duplicate downloads or processing errors
- Improved detection of document changes — edits are now picked up more consistently across all file types
- Better error reporting when a document cannot be found in the DMS — users now see a clear message instead of a silent failure

Security

- Sensitive credentials are no longer written to diagnostic log files

General

- Reduced unnecessary log output on macOS for quieter operation
- Improved notification reliability across platforms
